*Nonlinear dynamics in storage rings:
from modelling to experiment*
Grenoble, May 26-28, 2008

Contents

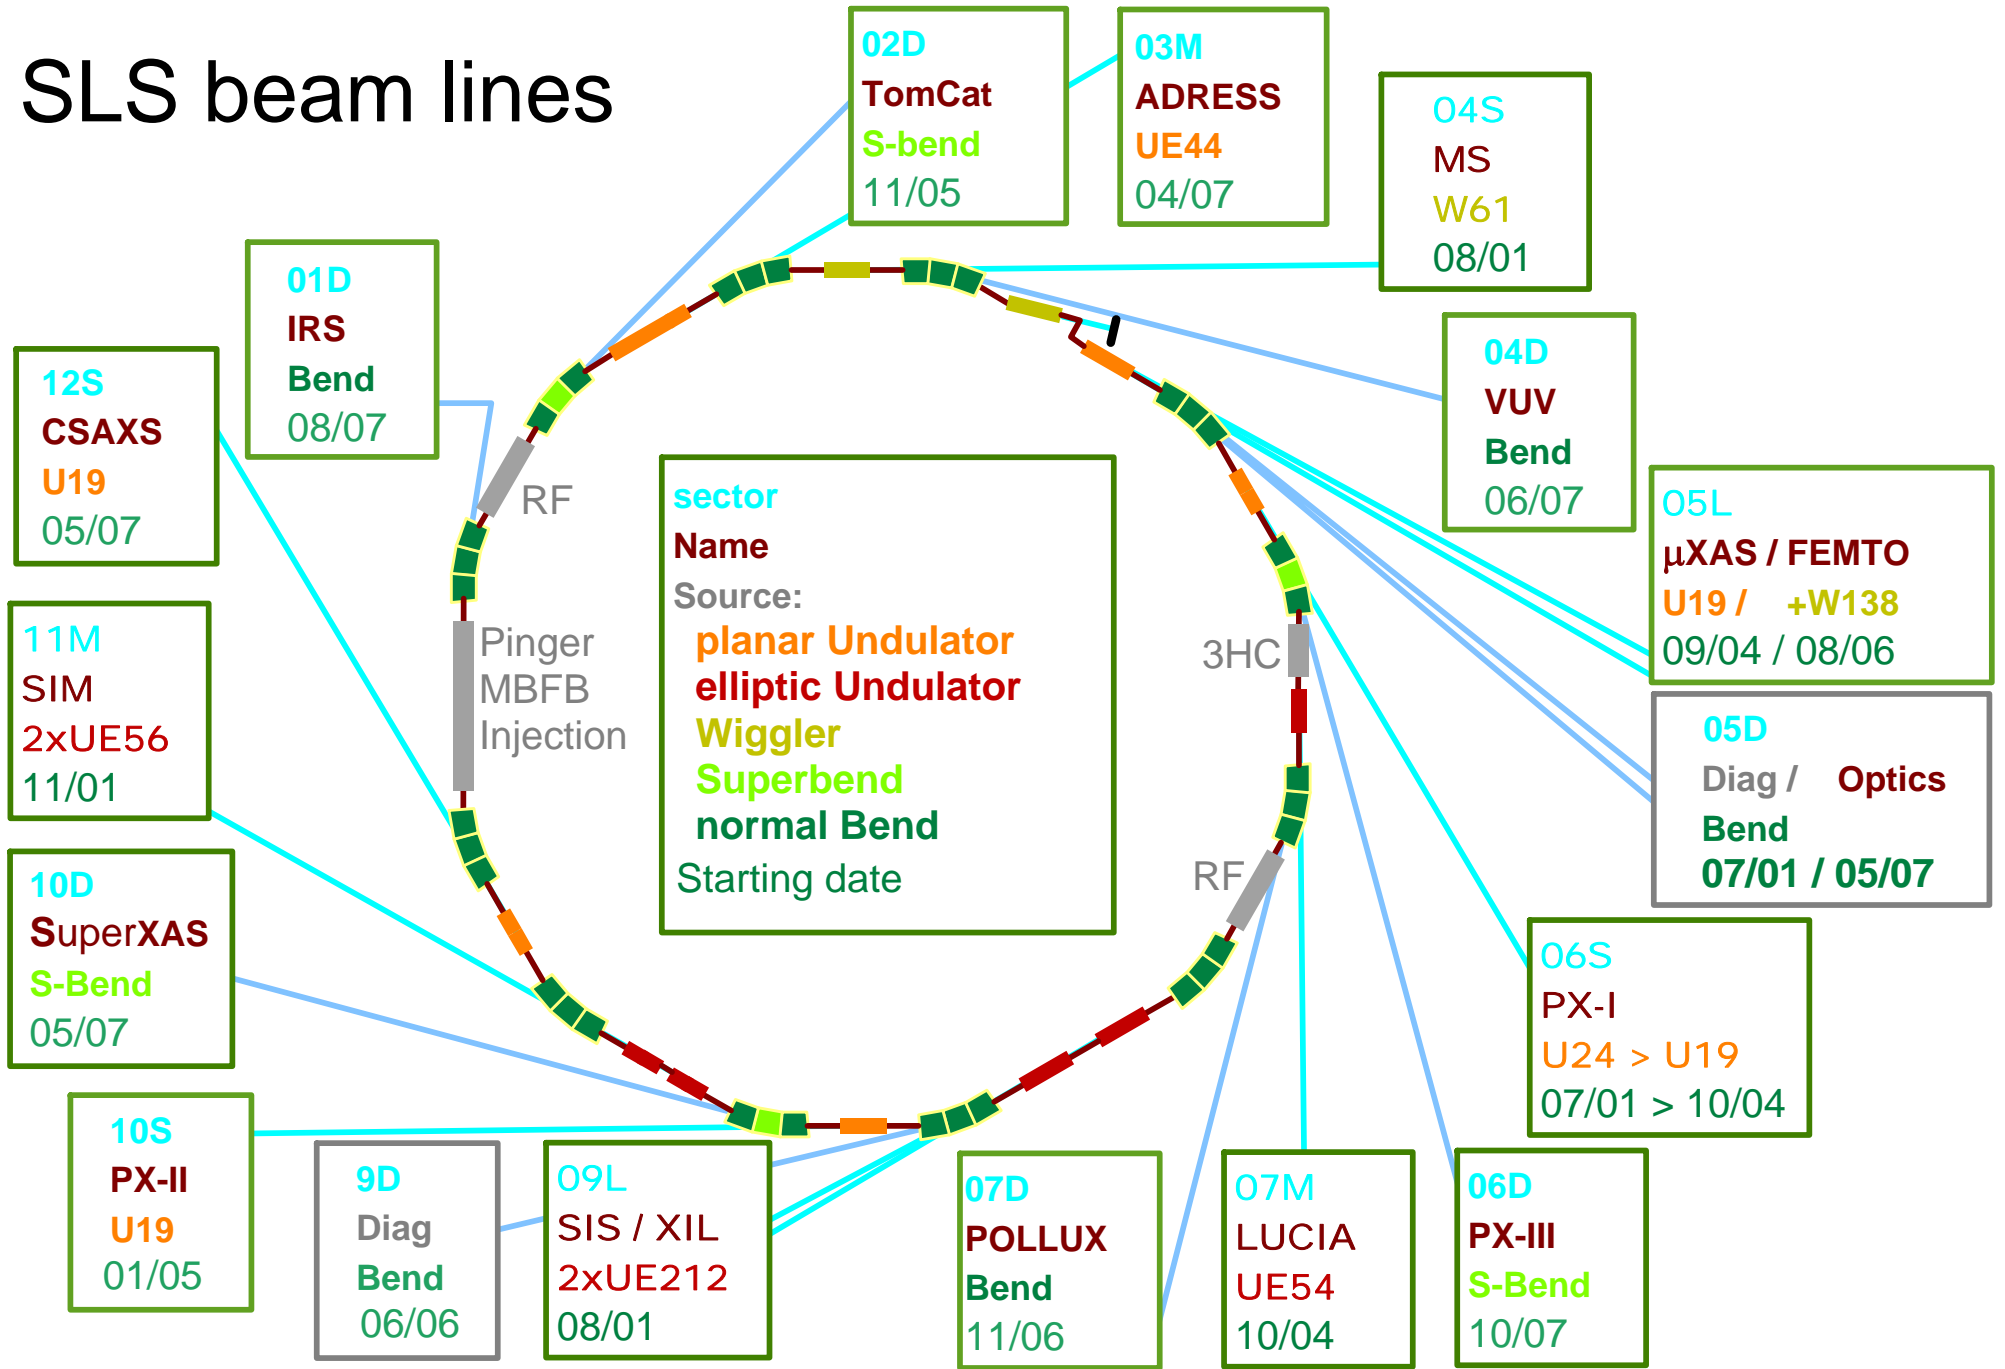

- Status and parameters of the SLS
- Vertical acceptance and elastic scattering lifetime
 - residual gas composition
- Horizontal acceptance
 - amplitude dependant tune shifts
- Momentum acceptance and Touschek lifetime
 - problems of large chromaticity
 - dangerous resonances and how to suppress
 - coupling and scraper experiments
 - conclusions
- Summary

The Swiss Light Source SLS

- 12xTBA lattice, 288 m circumference, 2.4 GeV
- 5.0...6.8 nm emittance (dep. on ID status)
- 400 ± 1 mA top up operation
- User operation since 7 years, 98% availability
- Upgrades: Femto laser slicing & 3 superbends
- 1 micron photon beam stability at front end
- 3 pm rad vertical emittance (0.05% coupling)

SLS beam lines

Vertical acceptance

Measurement (T·P) vs. scraper to determine acceptance and residual gas composition and to estimate coupling:

Vertical acceptance and elastic scattering lifetime

- Aperture limitation before 2006:
W61 chamber (2 m x 5 mm, $\beta_y = 2$ m): $A_y = 3$ mm mrad
- Measurement: $A_y \approx 1.0$ mm mrad
chamber realignment $\Rightarrow A_y \approx 1.5...1.8$ mm mrad - ?
- Aperture limitation since 2006:
FEMTO wiggler (2.4 m x 8 mm, $\beta_y = 7.7$ m): $A_y = 2$ mm mrad
- Measurement: $A_y \approx 1.5...1.8$ mm mrad
- Residual gas:
no beam: 0.6 pbar, ~ 20% CO
400 mA: 4.0 pbar, ~ 10% CO
- ◆ Lifetime not limited by vertical acceptance
 \Rightarrow Lower gaps (4 mm), rounder beams ($\beta_y \uparrow$)
 \Rightarrow W61 chamber will be removed \Rightarrow dedicated scraper.

Horizontal acceptance

Simulation (ideal lattice):

$A_x = 30$ mm mrad

break up at $5Q_x=102$ resonance?

$A_x = 18$ mm mrad

Maximum excitation from pinger:

$A_x = 11$ mm mrad.

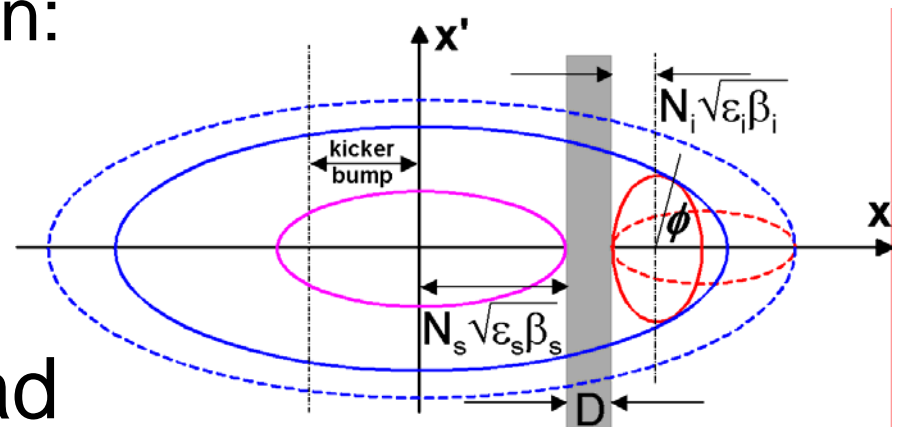

Acceptance limit not reached

Minimum requirement for injection:

$A_x > 8$ mm mrad

100% efficiency possible
(usual 90..95%), but little margin

Conclusion: $A_x > 11$ mm mrad

Amplitude dependant tune shift measurements

-----Theory: $dQ_x/dA_x = -1200/m$ (nominal) / set to **+5000**; **-5000**/m
 ◇...◇...◇ measurement and fit

Momentum acceptance and Touschek Lifetime

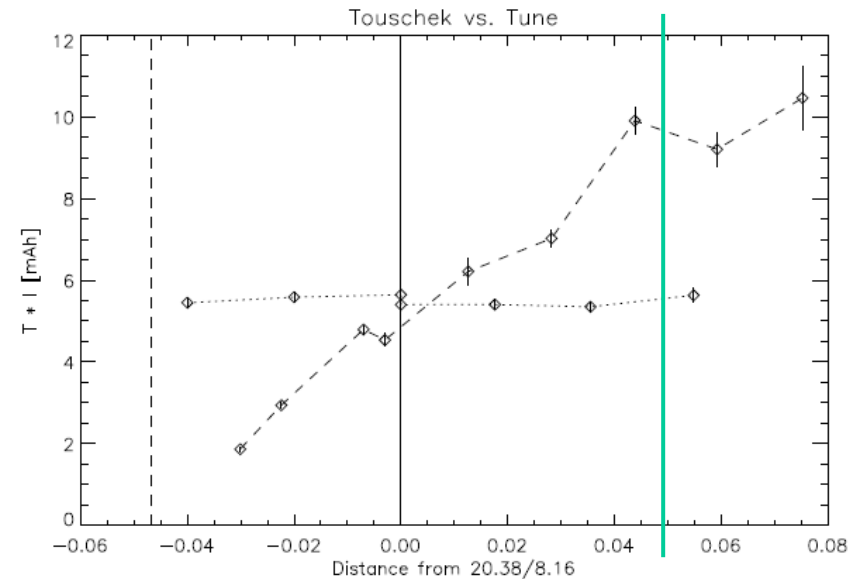

- Lifetime strong function of chromaticity:
[set] chromaticity: +1 \rightarrow +5 \Rightarrow Lifetime: 20 hr \rightarrow 5 hr
- Early saturation of lifetime vs. RF voltage:
little gain $>$ 1.1 MV, i.e. for $dp/p >$ 1.8%
 \Rightarrow Lattice dp/p acceptance $<$ RF acceptance (3%)

Lattice acceptance limitation: prime suspect $3Q_x=61$

Touschek Lifetime vs. distance to
 $3Q_x=61$ resonance:

move Q_x 20.38 \rightarrow 20.43 (2001)

Ref.: A.Streun, SLS-TME-TA-2001-0191

Chromaticity Measurement (2008):

High (= operational)
and
low chromaticity.

Theory:

C_x = +5
C_{x2} = -152
C_y = +5
C_{y2} = +78

Beam spectra

Excitation by pingers

Betatron amplitudes:

$$A_x = 1.1 \text{ mm mrad}$$

$$A_y = 0.1 \text{ mm mrad}$$

Peaks in spectra

clear:

Fundamental: Q_x, Q_y [$\pm Q_s$]

Coupling: $Q_x \pm Q_y$

doubtful:

1st order sextupole:

$$3Q_x$$

$$Q_x \pm 2Q_y$$

2nd order sextupole (octupole):

$$2Q_x - 2Q_y$$

⇒ has a contribution from crosstalk $3Q_x \leftrightarrow Q_x + 2Q_y$

Ref.: J.Bengtsson, CERN 88-05

Optimization of sextupole Hamiltonian

Ref: J Renatsson .SLS-Note 9/97

$$h = \sum_n^{N_{\text{sext}}} V_n e^{i\Phi_n}$$

Sextupole_n ↔ complex vector:
 Length $V_n = V_n(b_3, L, \beta_x, \beta_y, D)$
 Angle $\Phi_n = \Phi_n(\phi_x + \phi_y)$

Systematic first order optimization:

9 terms h_{jklmp} (7 complex, 2 real)
 → 16 sextupole families

⇒ Symmetry:

$Im(h_{jklmp}) = 0 \rightarrow 9$ sextupole families.

Problem: Sextupoles in **families** can't access h_{jklmp} -phases
 ⇒ auxiliary sextupoles to break lattice symmetry (→ 2008/09):

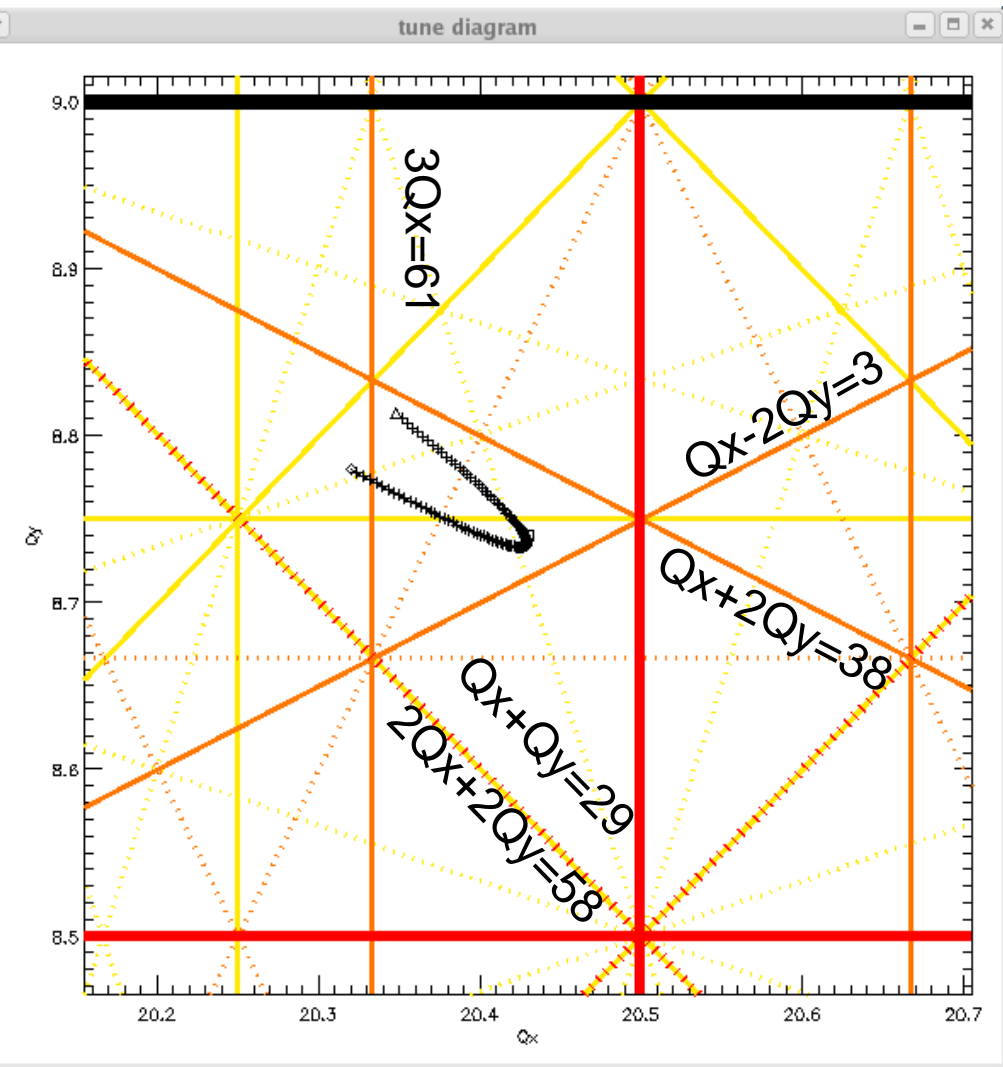

Tune Diagram for high chrom. +3.8/+4.4

dp/p = -3%...0...+3% (Δ +++ \square +++ \diamond);

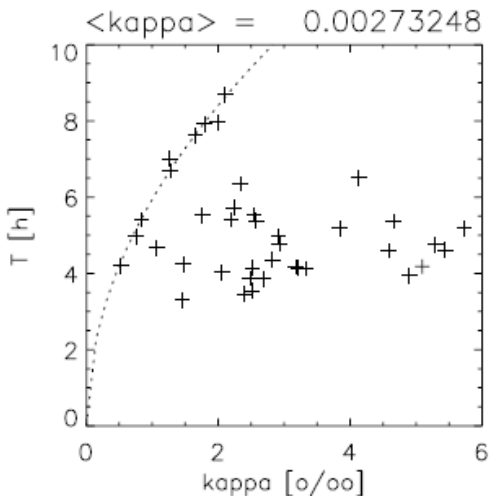

\approx zero chrom. -0.5/-0.5

order 1,2,3,4; regular _____ skew.....

\Rightarrow Is the main coupling ($Q_x + Q_y = 29$) the culprit and $3Q_x = 61$ innocent?

Touschek lifetime and coupling

Simulation:

T vs. coupling for 50 misalignment seeds with and without coupling suppression using 6 skew quads.

Å. Andersson et al, NIM A, in press

Coupling \rightarrow 0.15 %

a) 50 mA in 390 bunches:
elastic scattering

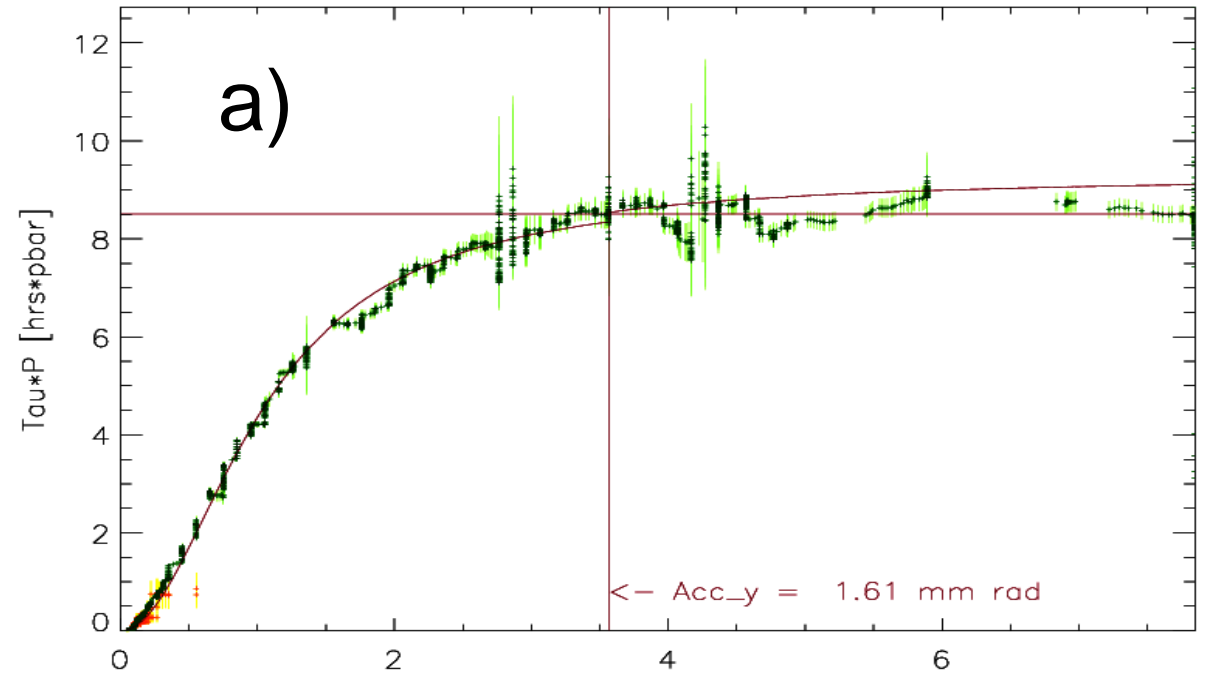

+++ measurements
----- lifetime fit

b) 50 mA in 50 bunches:
Touschek scattering

+++ measurements
+++ Touschek only
----- averaging

Touschek lifetime still
affected by vertical
aperture.

Momentum acceptance and Touschek lifetime: Conclusions

- Low chromaticity 0...+1
 $(dp/p)_{acc} \sim 3\%$ (like RF), $T \approx 14 \text{ hrs } (k[\%])^{1/2} / I_b[\text{mA}]$
 - High chromaticity +5
 $(dp/p)_{acc} \rightarrow \sim 1.5\%$ (loc.), $T \approx 6 \text{ hrs } (k[\%])^{1/2} / I_b[\text{mA}]$
Problem: crossing of main coupling and 3Qx
- ⇒ move working point away from main coupling
- ⇒ auxiliary sextupoles for h -phase rotation (3Qx et al.)
- ⇒ improve multi bunch feedback to reduce chroma.
- status: 3rd harmonic cavity: $T \rightarrow 3 \cdot T$
- ⇒ $T = 7 \dots 8 \text{ hrs}$ at 400 mA (390 bunches), $k \approx 0.15 \%$
 - ⇒ 60..80 sec top-up interval for $\Delta I = 1 \text{ mA}$

Summary

- Vertical acceptance is well understood.
 - Margin for even lower gaps and round beams.
- Horizontal acceptance $<$ theory.
 - but sufficient for 100% injection efficiency.
 - further investigation required.
- Energy acceptance and Touschek lifetime:
 - good for low chromaticity, bad for high.
 - wide tune spread for high chromaticity leads to crossing of coupling and nonlinear resonances.
 - another working point and auxiliary sextupoles may help.
- Beam lifetime 8 hrs in user operation is acceptable.
